Lecture 1

Internet and World Wide Web

SE-805 Web 2.0 Programming (supported by Google)

<http://my.ss.sysu.edu.cn/courses/web2.0/>

School of Software, Sun Yat-sen University

Outline

- **The Internet**
- The World Wide Web (WWW)
- Web 2.0

What's the Internet?

咱上帽子不差钱
CRSM/168
2009.2.16.

- A Chinese town officer
 - “The Internet is an English agents’ net”
- A U.S. Senator
 - “series of tubes” (explanation)
- How many internets are there, anyway? Is The Google one of them?

The Internet

- Wikipedia: <http://en.wikipedia.org/wiki/Internet>
- A connection of computer networks using the Internet Protocol Suite (**TCP/IP**)
- What's the difference between the Internet and the World Wide Web (**WWW**)?
- **WWW = HTML* + HTTP(S)**
 - * Including CSS, JavaScript, and other browser enabled contents

Brief History

- Began as a US Department of Defense network called ARPANET (1960s-70s)
- Initial services: electronic mail, file transfer
- Opened to commercial interests in late 80s
- WWW created in 1989-91 by Tim Berners-Lee
- Popular web browsers released: Netscape 1994, IE 1995
- Amazon.com opens in 1995; Google in 1996
- Chinese First Connection with Internet: Chinese Academics Net, by Computer Applying Technology Institute of Beijing 1986
- First email, Sep. 14 1987, from CATIB, “Across the Great Wall we can reach every corner in the world”
- Chinese First Full Internet Connection: **NCFC** (National Computing and Networking Facility of China) 1994
- **Baidu** in 1999; **Taobao** in 2003

Key Aspects of the Internet

- Internet is for information sharing
- “internet” vs. “Internet”
- Subnetworks can stand on their own
- Computers can dynamically join and leave the network
- Built on open standards; anyone can create a new device
- Lack of centralized control (mostly)
- Everyone can use it with simple, commonly available software

People and Organizations

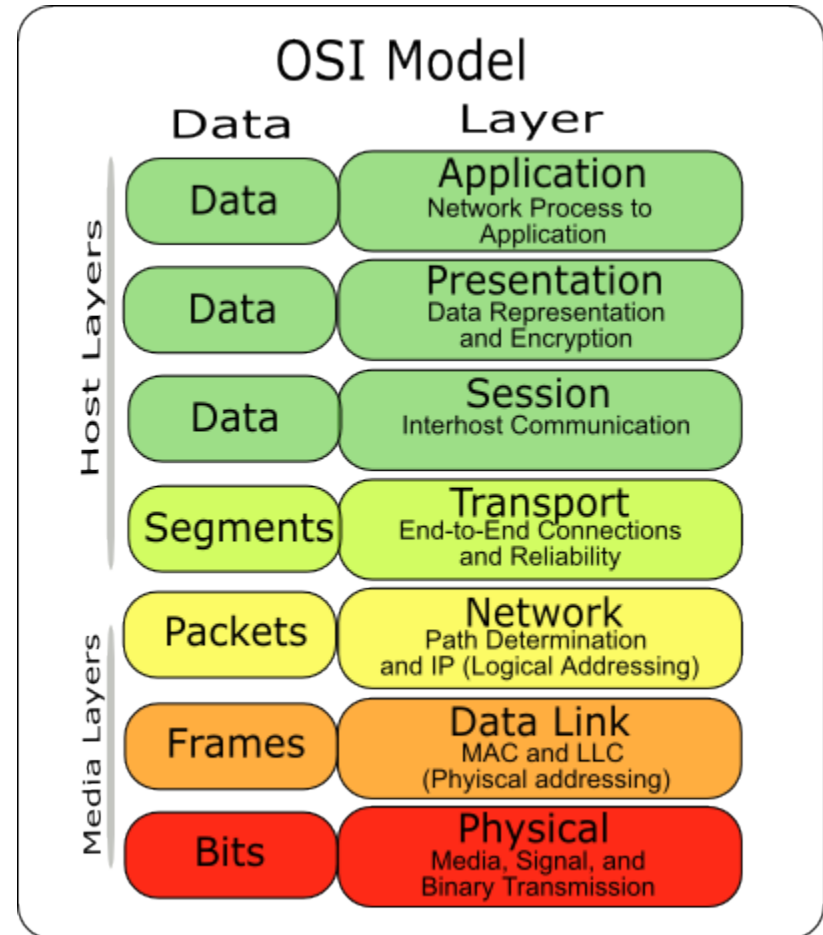

- Internet Engineering Task Force ([IETF](#)): internet protocol standards
- Internet Corporation for Assigned Names and Numbers ([ICANN](#)): decides top-level [domain names](#)
- World Wide Web Consortium ([W3C](#)): Web standards

Layered Architecture

The internet uses a layered hardware/software architecture (OSI model):

- **Physical layer:** devices such as coaxial cables, fiber-optic lines, modems
- **Data link layer:** basic hardware protocols (Ethernet, Wi-Fi, DSL, ATM, PPP)
- **Network / internet layer:** basic software protocols (i.e. IP)
- **Transport layer:** adds reliability to network layer (TCP, UDP)
- **Application layer:** implements specific communication for each kind of program (HTTP, POP3/IMAP, SSH, FTP)

Internet Protocol (IP)

- **IP** is the underlying protocol of communication for all data (packets) sent across the internet.
- Each device has a 32-bit IP address, shown as four 8-bit numbers (0-255)

- Find out your internet IP address: whatismyip.com
- Find out your local IP address:
 - in a terminal, type: **ipconfig** (Windows) or **ifconfig** (Mac/Linux)
- IP v4 vs. IP v6 (32-b vs. 128-b)

Transmission Control Protocol (TCP)

- Adds multiple, guaranteed message delivery on top of IP
- **Multiplexing**: multiple programs using the same IP address
 - **Port**: a number given to each program or service
 - 80: Web browser (443 for secure browsing)
 - 25: Email
 - 22: SSH
 - 21: FTP
 - More common ports
- Some programs (QQ, games, streaming media programs) use simpler UDP protocol instead of TCP
- Find out ports used:
 - In a terminal, using **netstat** (Windows) command
 - Using CurrPorts

Outline

- The Internet
- **The Word Wide Web (WWW)**
- Web 2.0

Web Servers and Browsers

- **Web server:** software that listens for Web page requests
 - [Apache](#)
 - Microsoft Internet Information Server (IIS) ([part of Windows](#))
- **Web browser:** fetches/displays documents from Web servers
 - Microsoft [Internet Explorer](#) (IE)
 - [Mozilla Firefox](#)
 - Apple [Safari](#)
 - [Google Chrome](#)
 - [Opera](#)

Domain Name System (DNS)

- A set of servers that map written names to IP addresses
 - Example: www.sysu.edu.cn → 202.116.64.9
 - Using Windows command **nslookup** to find out IP address
 - Non-english languages in domain name [IDN ccTLD Fast Track](#)
- Many systems maintain a local cache called a [host file](#)
 - Windows: [C:\Windows\system32\drivers\etc\hosts](#)
 - Mac: [/private/etc/hosts](#)
 - Linux: [/etc/hosts](#)

Uniform Resource Locator (**URL**)

- An identifier for the location of a document on a web site
- A basic URL:

<http://www.aw-bc.com:80/info/regesstepp/index.html>

~~~ ~~~~~ ~~~~~ ~~~~~  
protocol host port path

- Upon entering this **URL** into the browser, it would:
  - Ask the DNS server for the IP address of `www.aw-bc.com`
  - Connect to that IP address at port 80
  - Ask the server to `GET /info/regesstepp/index.html`
  - Display the resulting page on the screen

# More Advanced URLs

---

- **Anchor**: jumps to a given section of a web page  
<http://www.textpad.com/download/index.html#downloads>
  - Fetches index.html then jumps down to the part of the page labeled downloads
- **Port**: for web servers on ports other than the default 80  
<http://www.cs.washington.edu:8080/secret/money.txt>
- **Query string**: a set of parameters passed to a web program  
<http://www.google.com/search?q=miserable+failure&start=10>
  - Parameter `q` is set to "miserable+failure"
  - parameter `start` is set to 10

# HyperText Transport Protocol (HTTP)

---

- The set of commands understood by a web server and sent from a browser
- Some HTTP commands (your browser sends these internally):
  - **GET** *filename* : download
  - **POST** *filename* : send a web form request
  - **PUT** *filename* : upload
  - **DELETE** *filename*: remove entity
  - **HEAD** *filename*: only status information, not entire content
- Simulating a browser with a terminal window:

```
$ telnet www.sysu.edu.cn 80  
Trying 202.116.64.9... Connected to 202.116.64.9  
(202.116.64.9). Escape character is '^'.  
GET /2009/xxgk.html  
<!DOCTYPE HTML PUBLIC "-//W3C//DTD HTML 4.0  
..."> <html> ...
```

# HTTP Error Codes

---

- When something goes wrong, the web server returns a special "error code" number to the browser, possibly followed by an HTML document
- Common error codes:

| Number                        | Description                                 |
|-------------------------------|---------------------------------------------|
| 200                           | OK                                          |
| <a href="#">301-303</a>       | page has moved (permanently or temporarily) |
| <a href="#">403</a>           | you are forbidden to access this page       |
| <a href="#">404</a>           | page not found                              |
| 500                           | internal server error                       |
| <a href="#">complete list</a> |                                             |

# Internet Media (**MIME**) Types

---

- Sometimes when including resources in a page (style sheet, icon, multimedia object), we specify their type of data

| MIME Type                | File Extension             |
|--------------------------|----------------------------|
| text/html                | .html , .htm, shtml, .shtm |
| text/plain               | .txt                       |
| image/gif                | .gif                       |
| image/jpeg               | .jpg                       |
| video/quicktime          | .mov                       |
| application/octet-stream | .exe                       |

- Lists of MIME types: [by type](#), [by extension](#)
- “.html” vs. “.htm”

# Web Languages / Technologies

---

- HyperText Markup Language ([HTML](#)): used for writing web pages
- Cascading Style Sheets ([CSS](#)): stylistic info for web pages
- PHP HyperText Processor ([PHP](#)): dynamically create pages on a web server – *of course, there are many other languages and scripts that can do this ...*
- [JavaScript](#): interactive and programmable web pages
- Asynchronous JavaScript and XML ([AJAX](#)): accessing data for web applications
- eXtensible Markup Language ([XML](#)): meta-language for organizing data
- Structured Query Language ([SQL](#)): interaction with databases
- Resource Description Frame ([RDF](#)): describing web resources semantically
- .....

# Terms

---

- **Internet Service Provider (ISP)**
  - Enterprises or organizations who provide Internet access to you,
  - Who? please identify your ISPs
- **Web Hosting**
  - Provide a place for consumers to store pages designed to be consumed by the Web surfing public
  - ISPs often offer Web hosting services along with their standard connectivity packages.
- **Client/Server** vs. **Browser/Server**
- **Presentation Layer**
  - Often refers to the top tier of enterprise application architecture
  - in Web, it includes both code of Web pages and code creating Web pages.
- **Client Side Scripting/Programming**
  - Writing code consumed by browsers to render Web pages and to respond to users' interactions
- **Server Side Scripting/Programming**
  - Writing code used to generate the code consumed by browsers

# Outline

---

- The Internet
- The Word Wide Web (WWW)
- **Web 2.0**

# Web 1.0 vs. Web 2.0

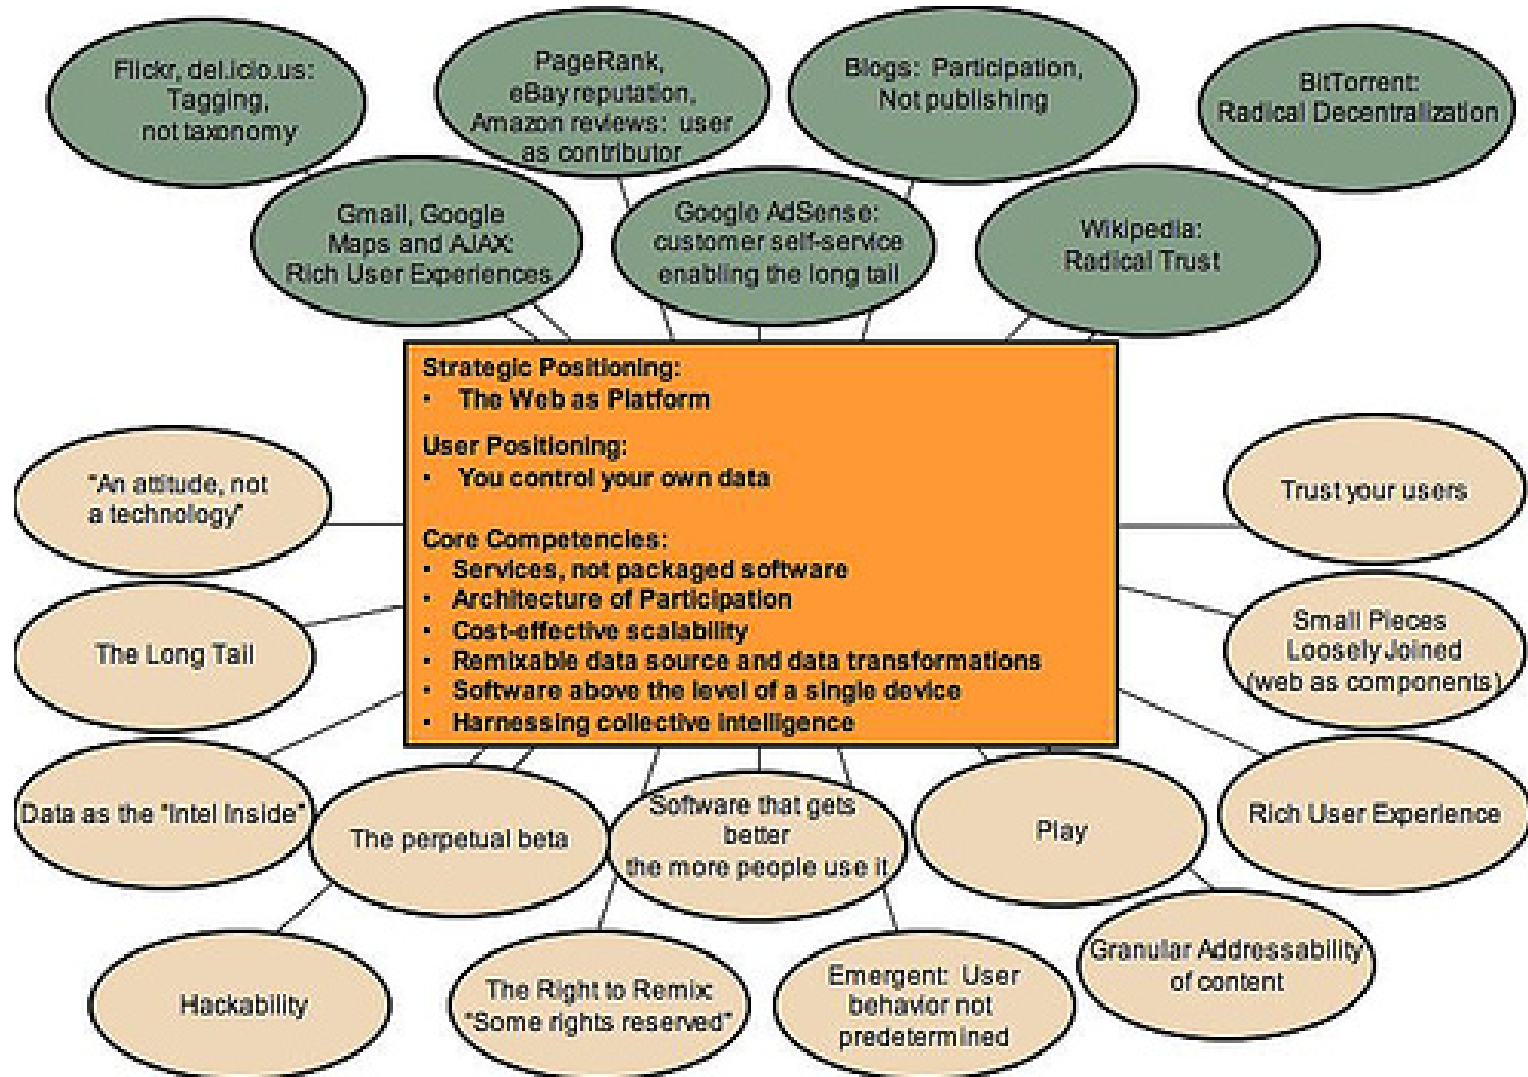

---

- **Web 1.0** is about **publishing**
  - Users are limited to the passive browsing of information that is provided to them
- **Web 2.0** is about **interaction**
  - Allows its users to interact with other users or to change website content
  - Information sharing, interoperability, user-centered design and collaboration
  - Hosted services, web applications, social-networking sites, video-sharing sites, wikis, blogs, mashups and folksonomies.
  - Coined by Tim O'Reilly in the O'Reilly Media Web 2.0 conference in 2004

# Web 2.0 Memo Map

<http://oreilly.com/web2/archive/what-is-web-20.html>

# Web 2.0 Examples

<http://oreilly.com/web2/archive/what-is-web-20.html>

| Web 1.0                    |     | Web 2.0                    |
|----------------------------|-----|----------------------------|
| DoubleClick                | --> | Google AdSense             |
| Ofoto                      | --> | Flickr                     |
| Akamai                     | --> | BitTorrent                 |
| mp3.com                    | --> | Napster                    |
| Britannica Online          | --> | Wikipedia                  |
| personal websites          | --> | blogging                   |
| evite                      | --> | upcoming.org and EVDB      |
| domain name speculation    | --> | search engine optimization |
| page views                 | --> | cost per click             |
| screen scraping            | --> | web services               |
| publishing                 | --> | participation              |
| content management systems | --> | wikis                      |
| directories (taxonomy)     | --> | tagging ("folksonomy")     |
| stickiness                 | --> | syndication                |

# 2.0 Flurry

---

- [Library 2.0](#), Classroom 2.0, Publishing 2.0, Learning 2.0
- Social Work 2.0, Enterprise 2.0, PR 2.0
- Medicine 2.0, Telco 2.0, [Travel 2.0](#)
- [Government 2.0](#)
- and even [Porn 2.0](#)
- These 2.0s refer to Web 2.0 technologies as the source of the new version in their respective disciplines and areas.

# Web 2.0 Technologies

---

## ● **Browser side**

- Asynchronous JavaScript and XML ([AJAX](#)),
- [RIA](#)
  - [Adobe Flash](#)
  - [JavaScript](#) / AJAX frameworks
    - [Prototype](#), [script.aculo.us](#), [Yahoo! UI Library](#), [Dojo Toolkit](#), [MooTools](#), [jQuery](#), [ExtJS](#), ...
  - Others
    - XUL, JavaFX, Silverlight, OpenLaszlo, ...

## ● **Server side**

- many of the same technologies as Web 1.0
  - [PHP](#), [Ruby](#), [ColdFusion](#), [Perl](#), [Python](#), [JSP](#), [Servlet](#), and [ASP](#)
- More different formats
  - [XML](#), [RSS](#), and [JSON](#) , why?

# Summary

---

- The Internet
  - History
  - Key aspects
  - People and organizations
  - Layered architecture
  - Protocols: IP, TCP
- The World Wide Web (WWW)
  - Servers and browsers
  - Protocols: DNS, URL, HTTP, MIME
  - Web languages / technologies
- Web 2.0
  - Features, advantages, applications, and technologies

# Exercises

---

- Use a terminal shell on your computer to fetch the homepage of the School of Software, Sun Yat-sen University
- Install the [Firefox](#) and the [Firebug](#) add-on

# Reading materials

---
